

Intro Web Applications

Andrew Benson – ScottyLabs – CrashCourse F14

ScottyLabs

ScottyLabs is a student organization at Carnegie Mellon University. We organize educational events to help people learn how to make things, host events to give students the opportunity to work on projects outside of class, and develop applications and services for the campus community.

What are we making?

- `crashdevblog.herokuapp.com`

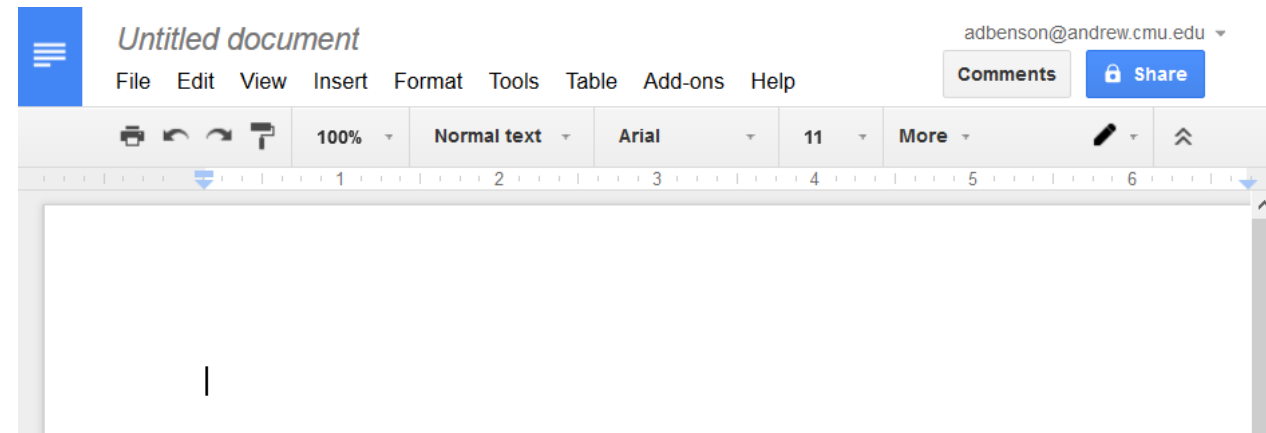

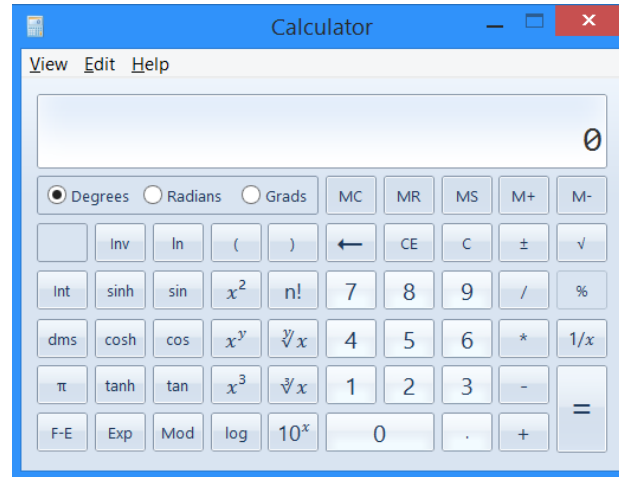

“Packaged Apps”

vs

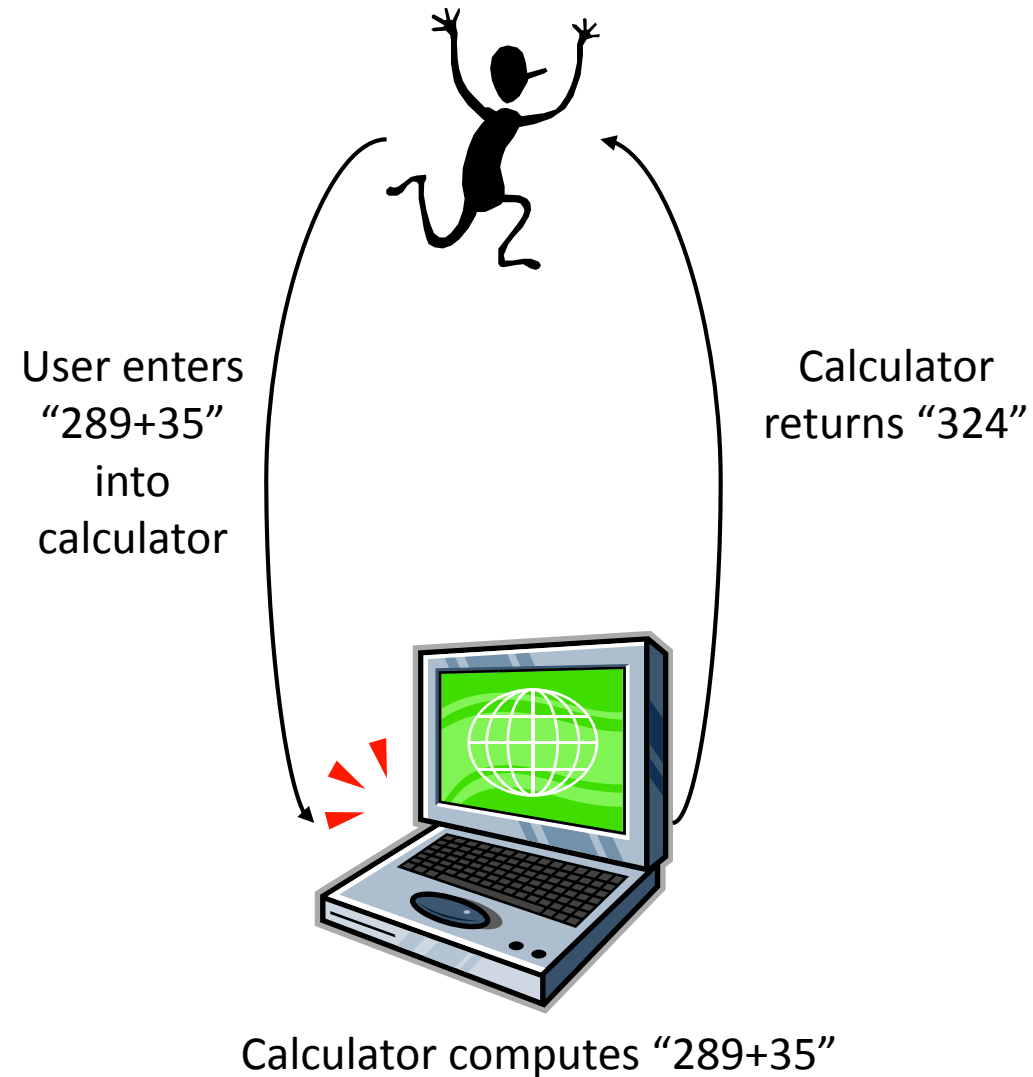

Web Apps

```
#include <stdio.h>
```

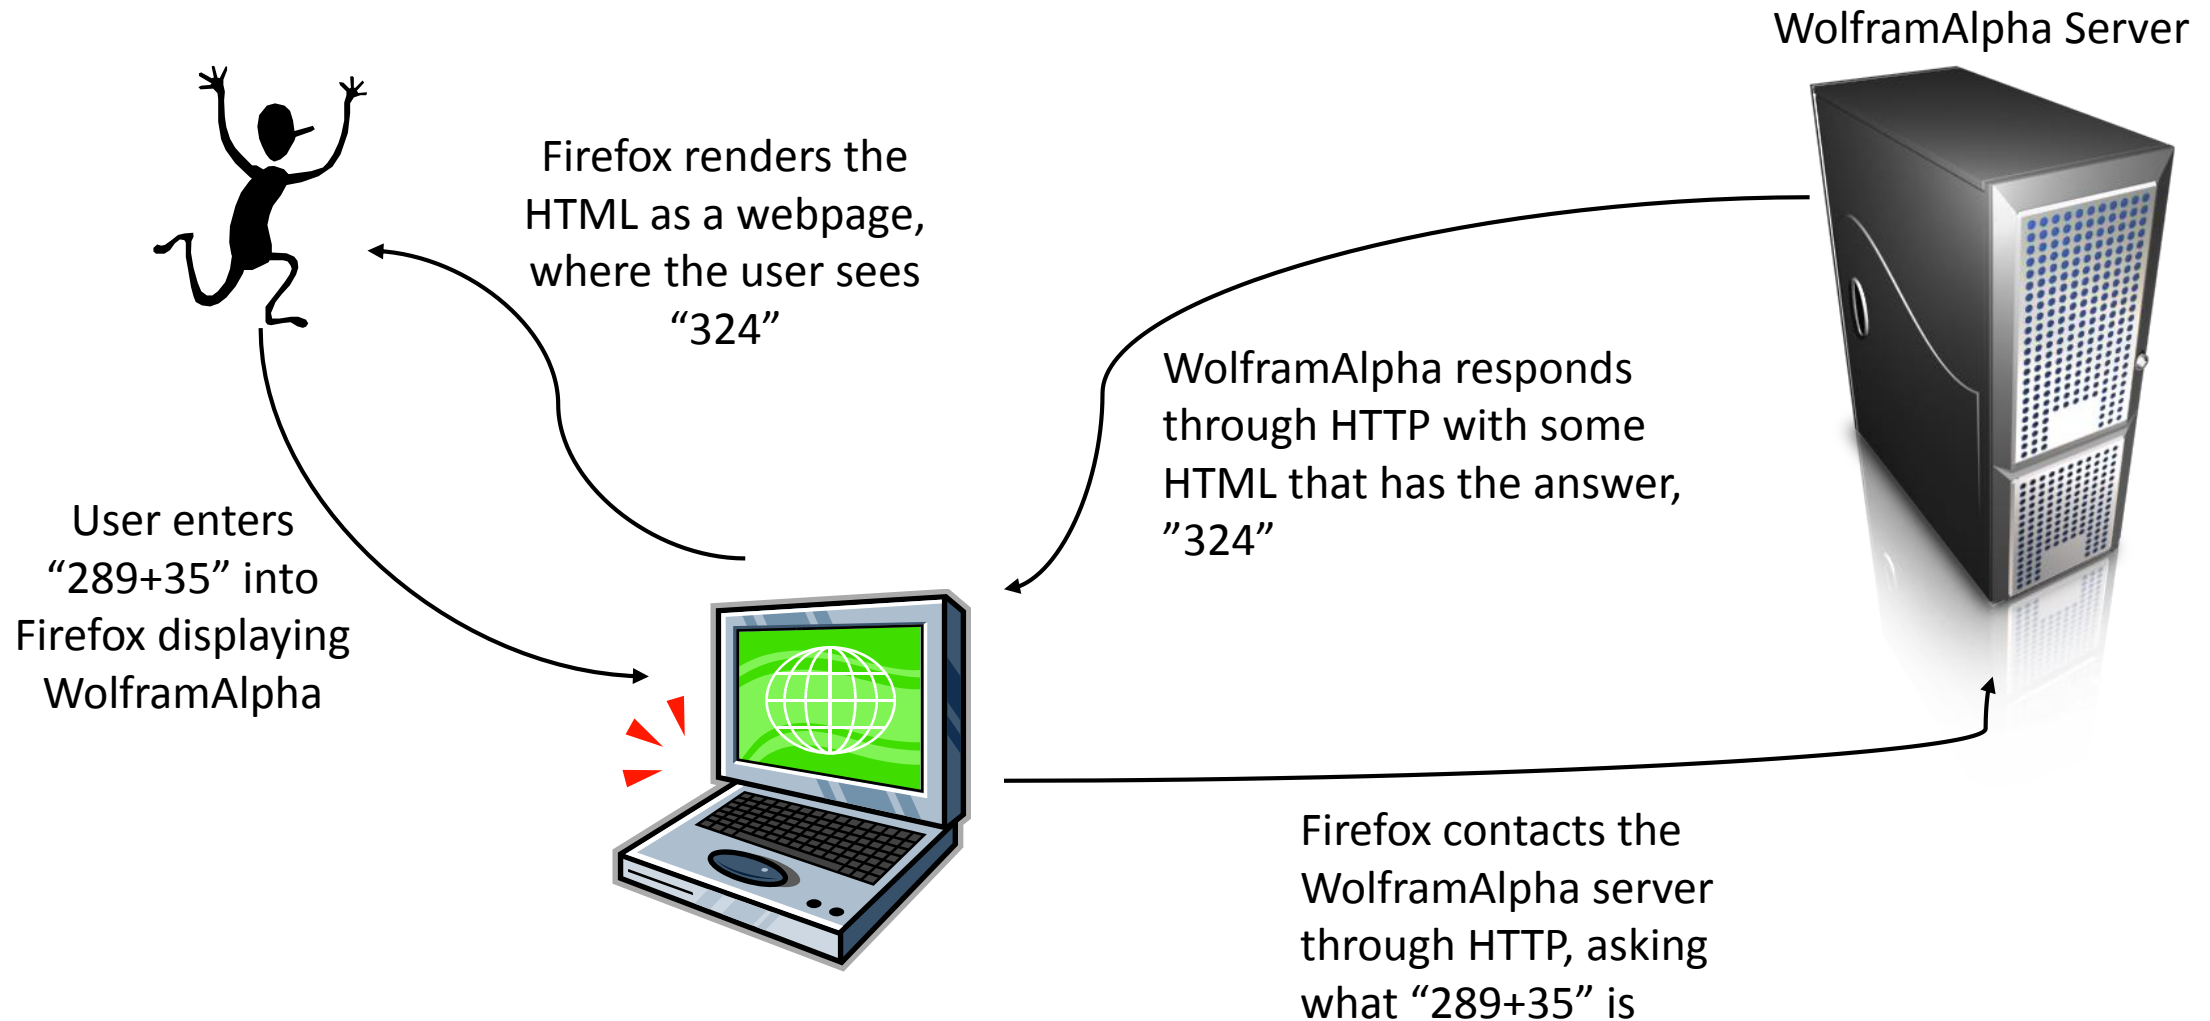

```
int main()  
{  
    printf("Hello World!\n");  
    return 0;  
}
```

How a “packaged” application works

How a web application works

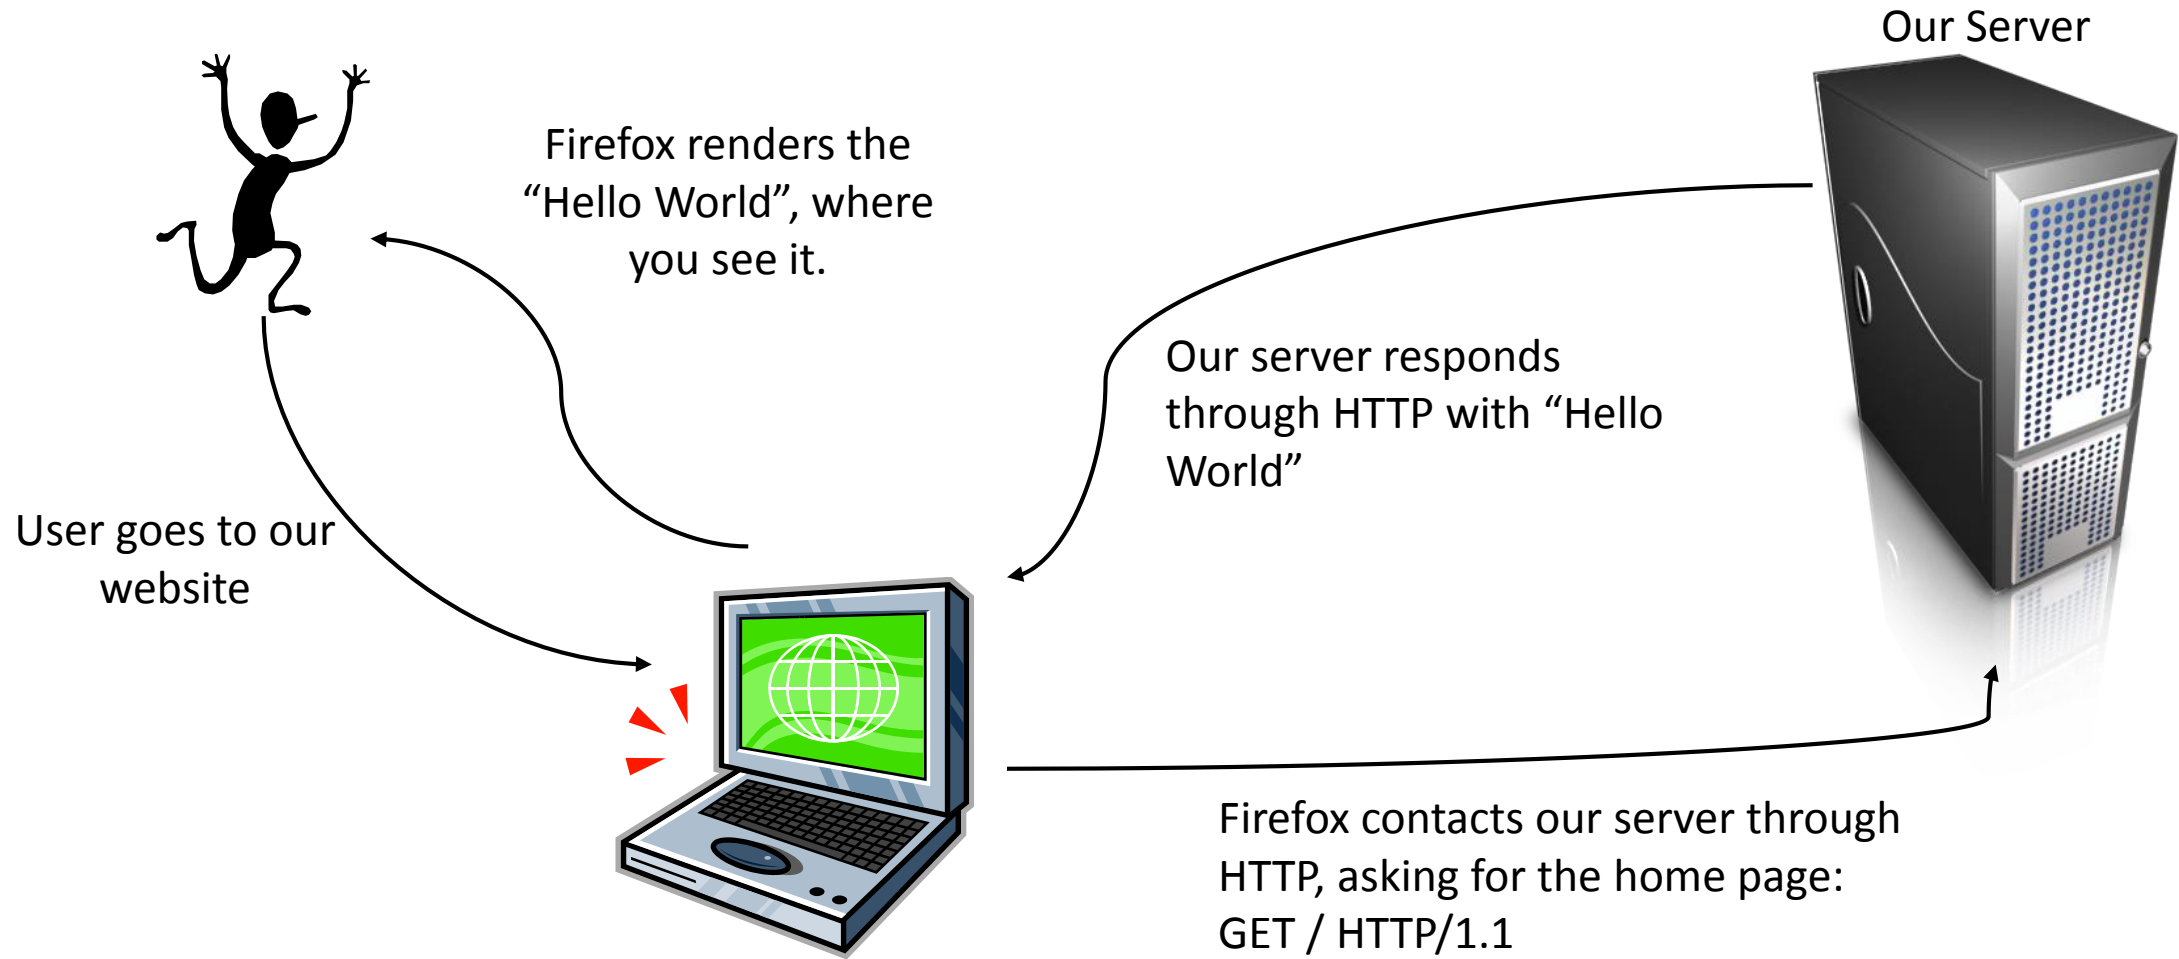

Making a server that says “Hello World”

SSH into Andrew Linux, and enter the following in a suitable directory:

- `git clone https://github.com/anbenson/crashdevblog-resources.git`
- `cd crashdevblog-resources`
- `curl -O https://pypi.python.org/packages/source/v/virtualenv/virtualenv-1.11.6.tar.gz`
- `tar -xzf virtualenv-1.11.6.tar.gz`
- `python virtualenv-1.11.6/virtualenv.py venv`
- `source venv/bin/activate`
- `pip install flask`
- `hostname`
- `python main.py`

Now open a web browser, and enter the result of typing “hostname” followed by “:8080”. So if hostname returned “unix3.andrew.cmu.edu”, I would enter “unix3.andrew.cmu.edu:8080”. Some of you may have conflicting ports – I will come around to help you.

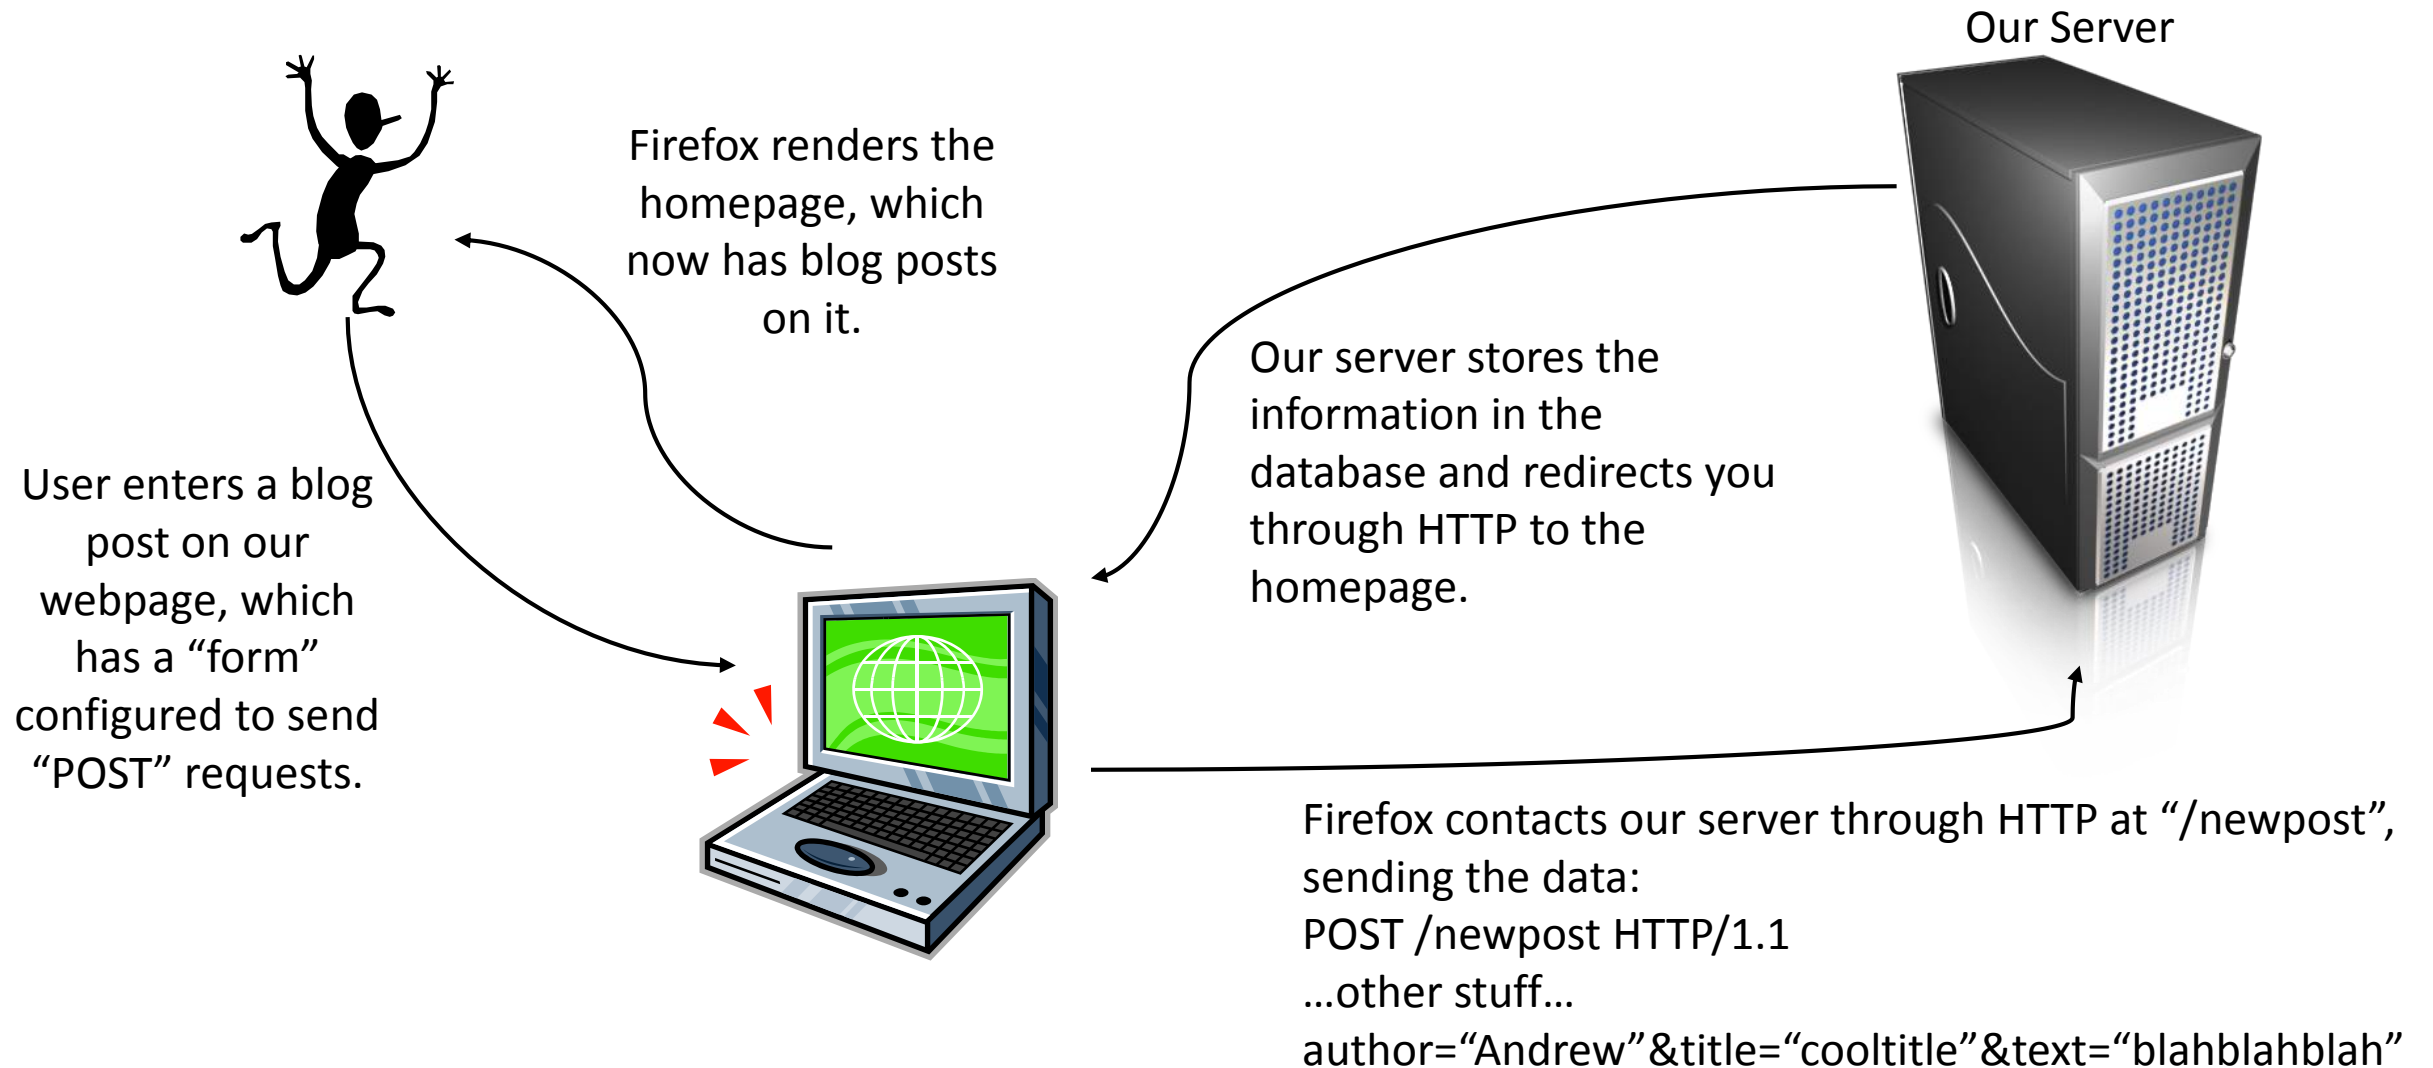

How our primitive server works

Rendering webpages instead of plain text

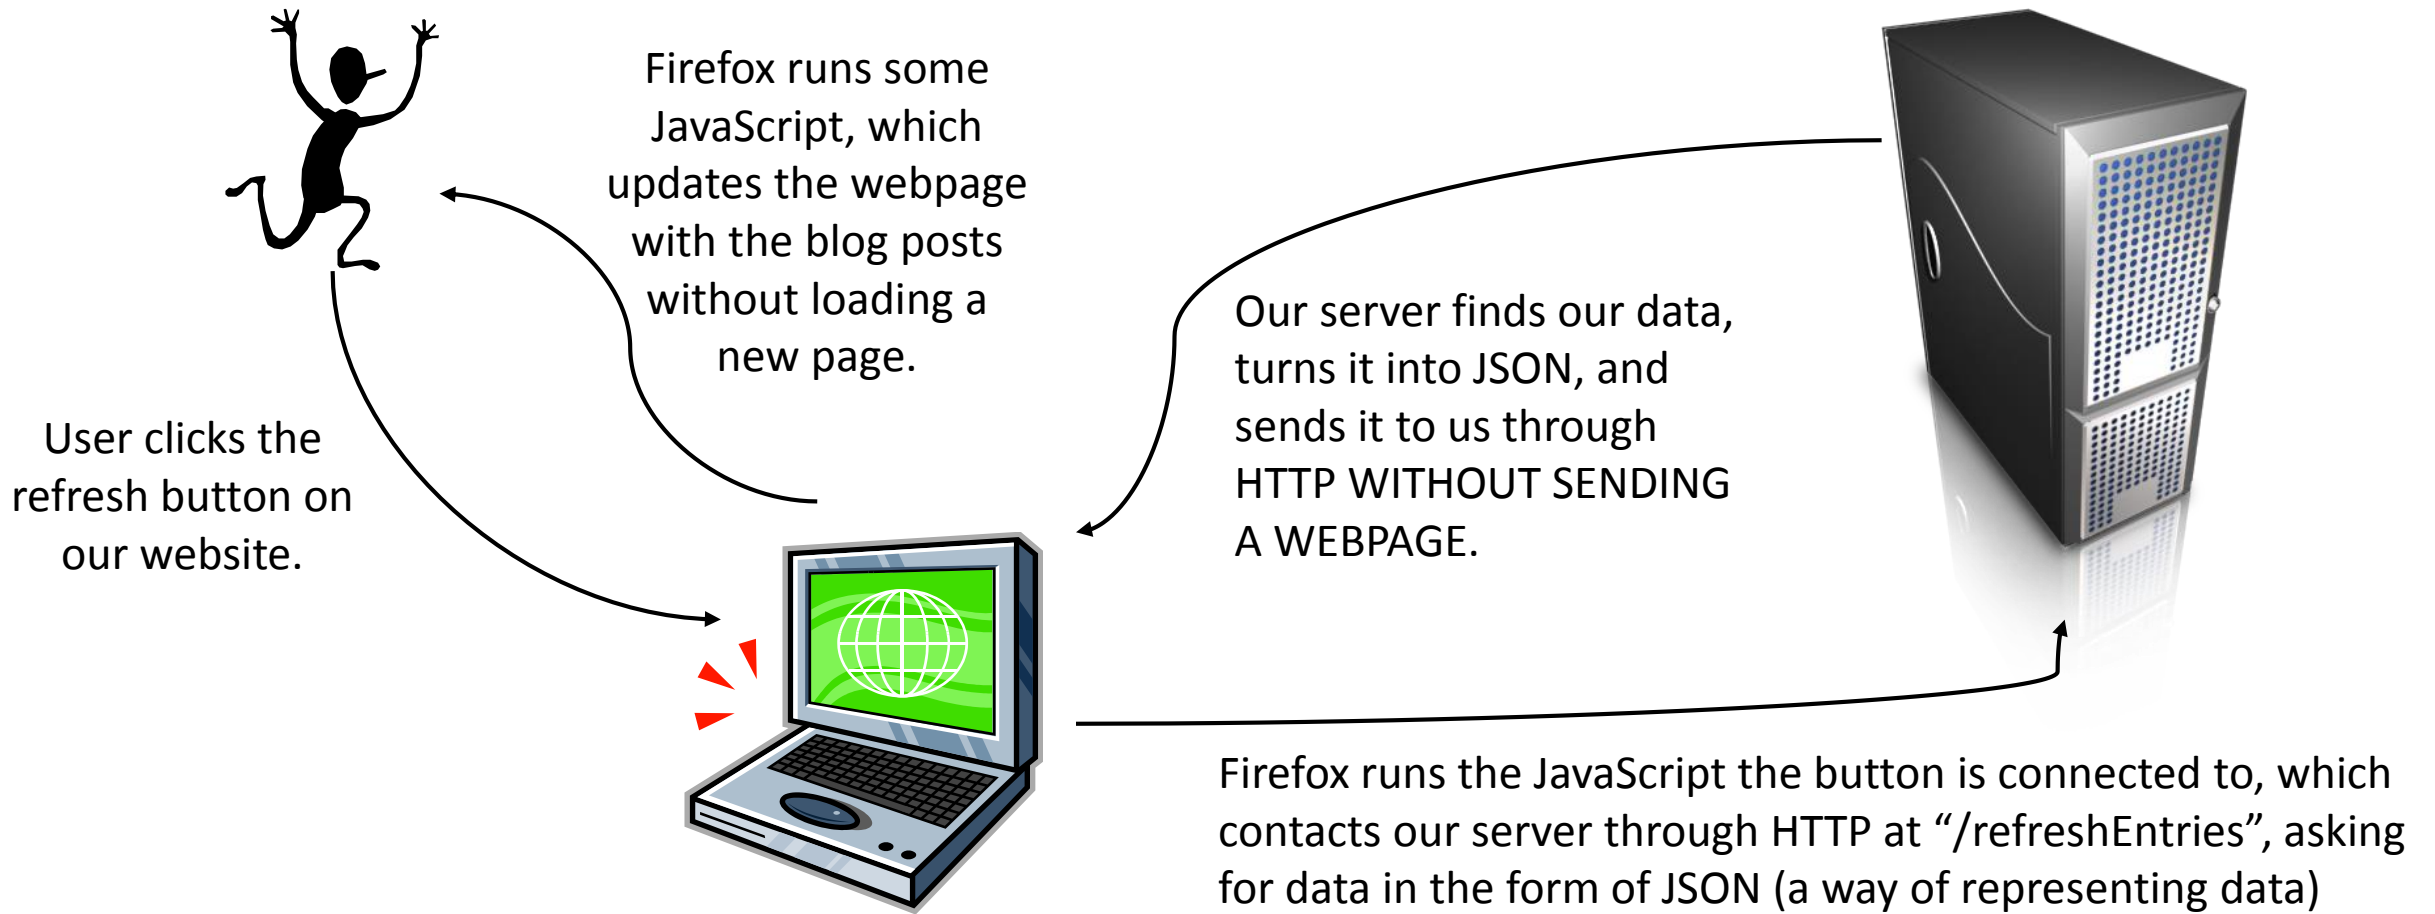

Exercise: Create handlers for “/about” and “/create”.

Sending information to the server

Putting blog posts in the database

AJAX – Asynchronous JavaScript And XML

Coding up the AJAX request on both ends
